SPECIALTY STEEL

You probably have many ideas in mind for projects that you would like to accomplish. The professional staff here at Fishkill is ready to help you develop those ideas into a viable and durable steel product. You will find an experienced staff member on hand to guide you through each phase of the process that will take you from your initial idea right through to the final installation.

- 1. On site measurements** — after discussing your needs to determine the general project type and requirements, a staff member will arrive to take the exact measurements as needed.
- 2. CAD drawings** — our drafting team, using a computer aided drafting system, will then draw up your project. These initial drawings will be sent to you for approval along with our price quote for the entire project.
- 3. Manufacturing** — upon receiving your purchase order we will proceed with detailed construction drawings as required and the manufacturing process will begin here at our Fishkill plant.
- 4. Installation** — we have trained staff to carry out the actual on site installation of your project.

We have the Technology

No matter what custom project you may envision, Fishkill has the right combination of knowledgeable staff and modern tools to turn it into a reality.

Future SOLUTIONS NOW

Our machine shop features a CNC milling machine which assures the precision and consistency needed to manufacture a quality product.

Likewise, our metal fabrication shop has two electronically controlled shearing machines which provide a digital measurement system so that all of our sheet steel is cut to the exact size needed. First time. Every time.

Our newly acquired Nisshinbo punch press is also computer controlled and boasts a rotating 20-tool turret head. This machine is capable of virtually any number and combination of punches with a single setup. The outstanding efficiency of the Nisshinbo has helped us to greatly reduce our manufacturing lead times and thereby bring our product to you, our customer, in a timely manner.

Quality Materials for Quality Products

Once the component parts are manufactured our welding booths are equipped to handle whatever comes their way. MIG, TIG, or STICK. Our trained welders are ready. Stainless steel? No problem.

And of course, no product is complete until the finish is applied. Fishkill offers several finishing options:

- Oven baked powder paint is available for items up to 6' by 8'.
- Liquid spray paint is an option for any size project.
- Galvanizing is also offered for those projects where low maintenance is desired.
